

WATER RESOURCES MANAGEMENT: LITHUANIAN EXPERIENCE

The Action Plan of the National Water Sector Plan for 2022-2027

A way towards achieving the environmental objectives

Updated Status of Water Bodies (2014-2019)

Risk water bodies

Improved data collection

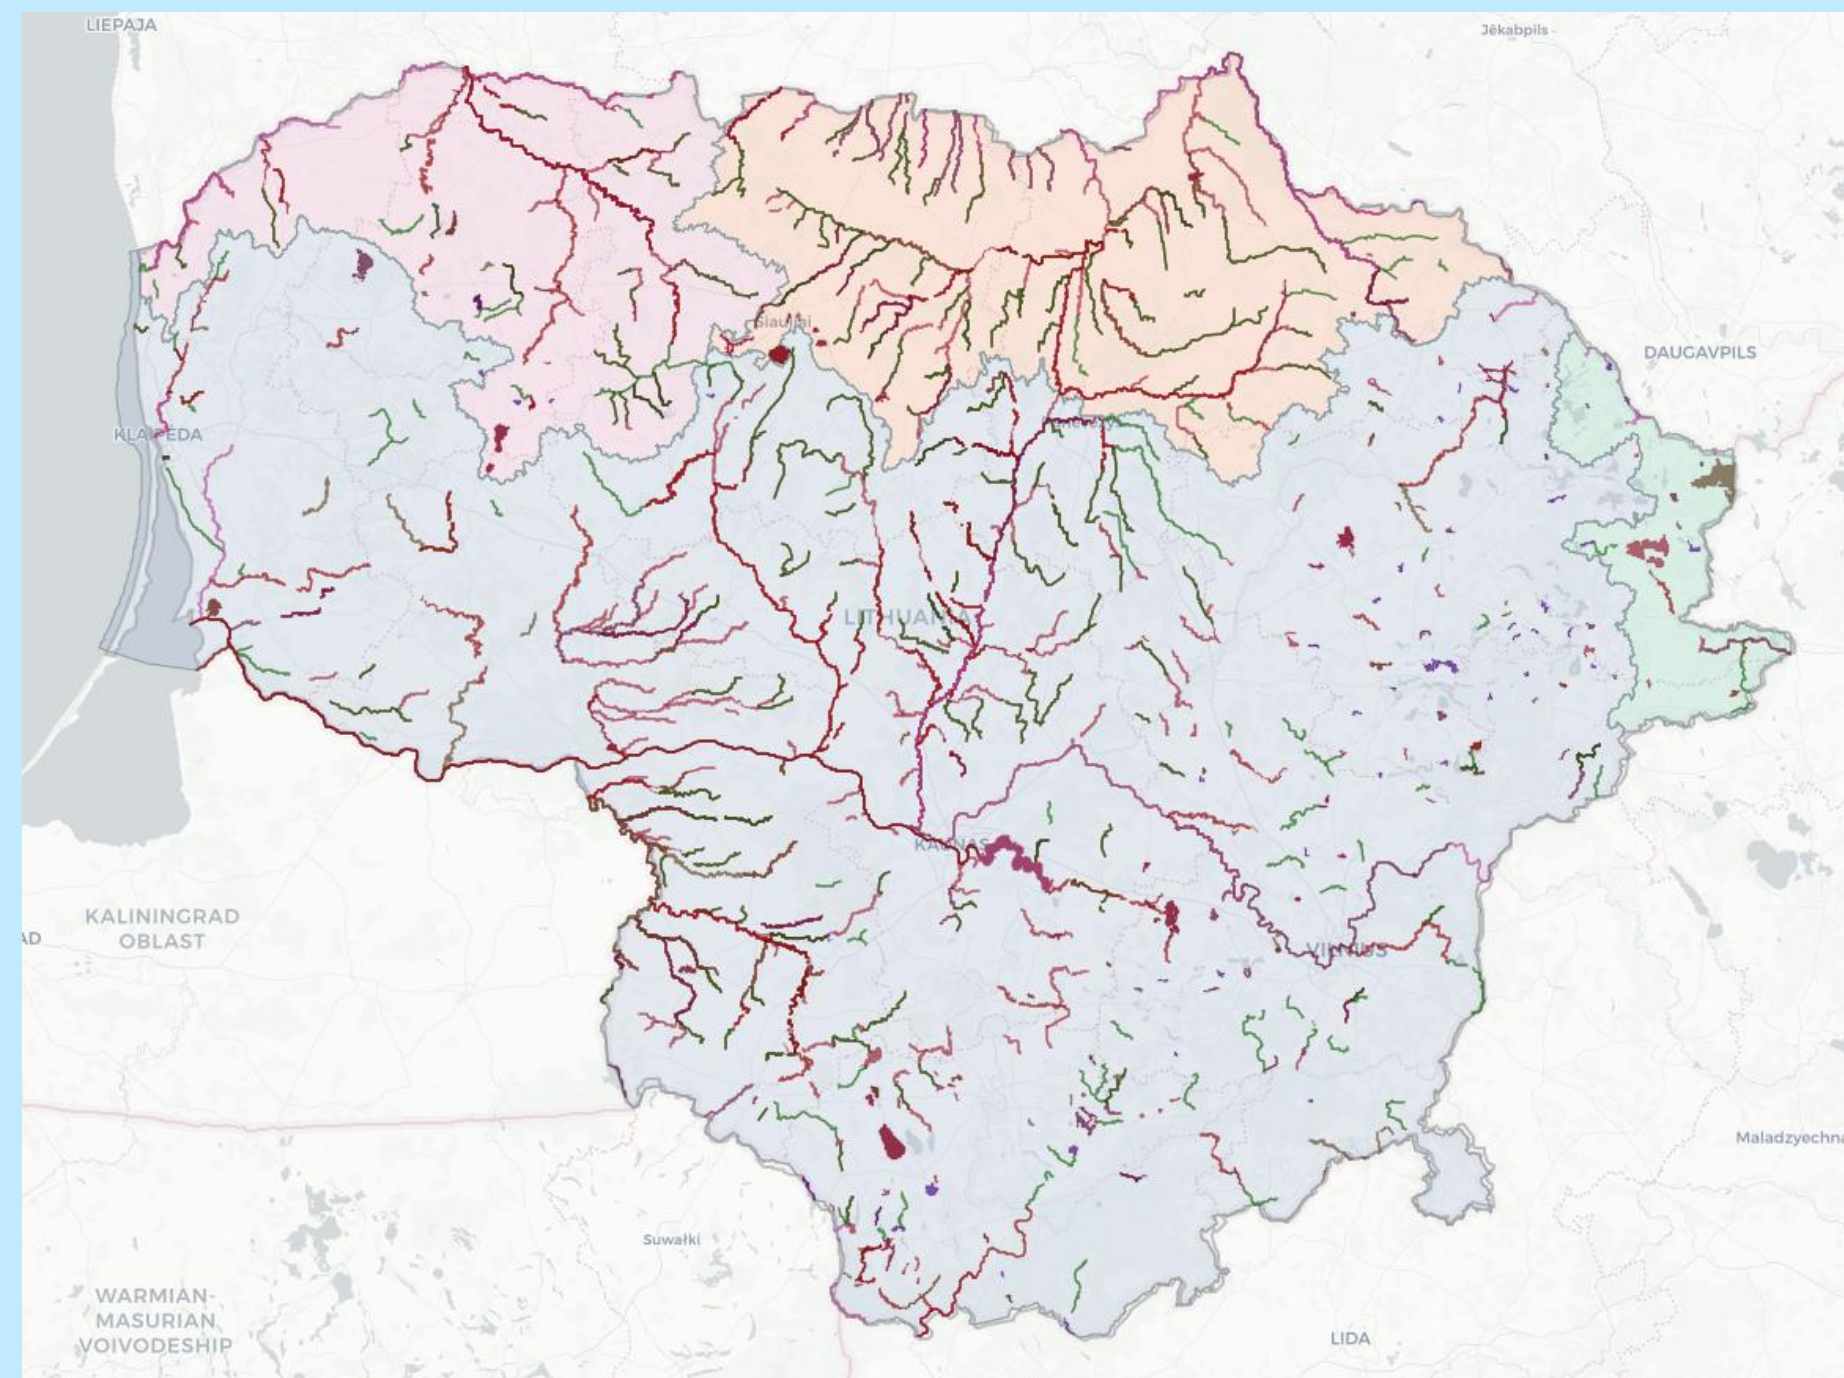

1,193 surface water bodies

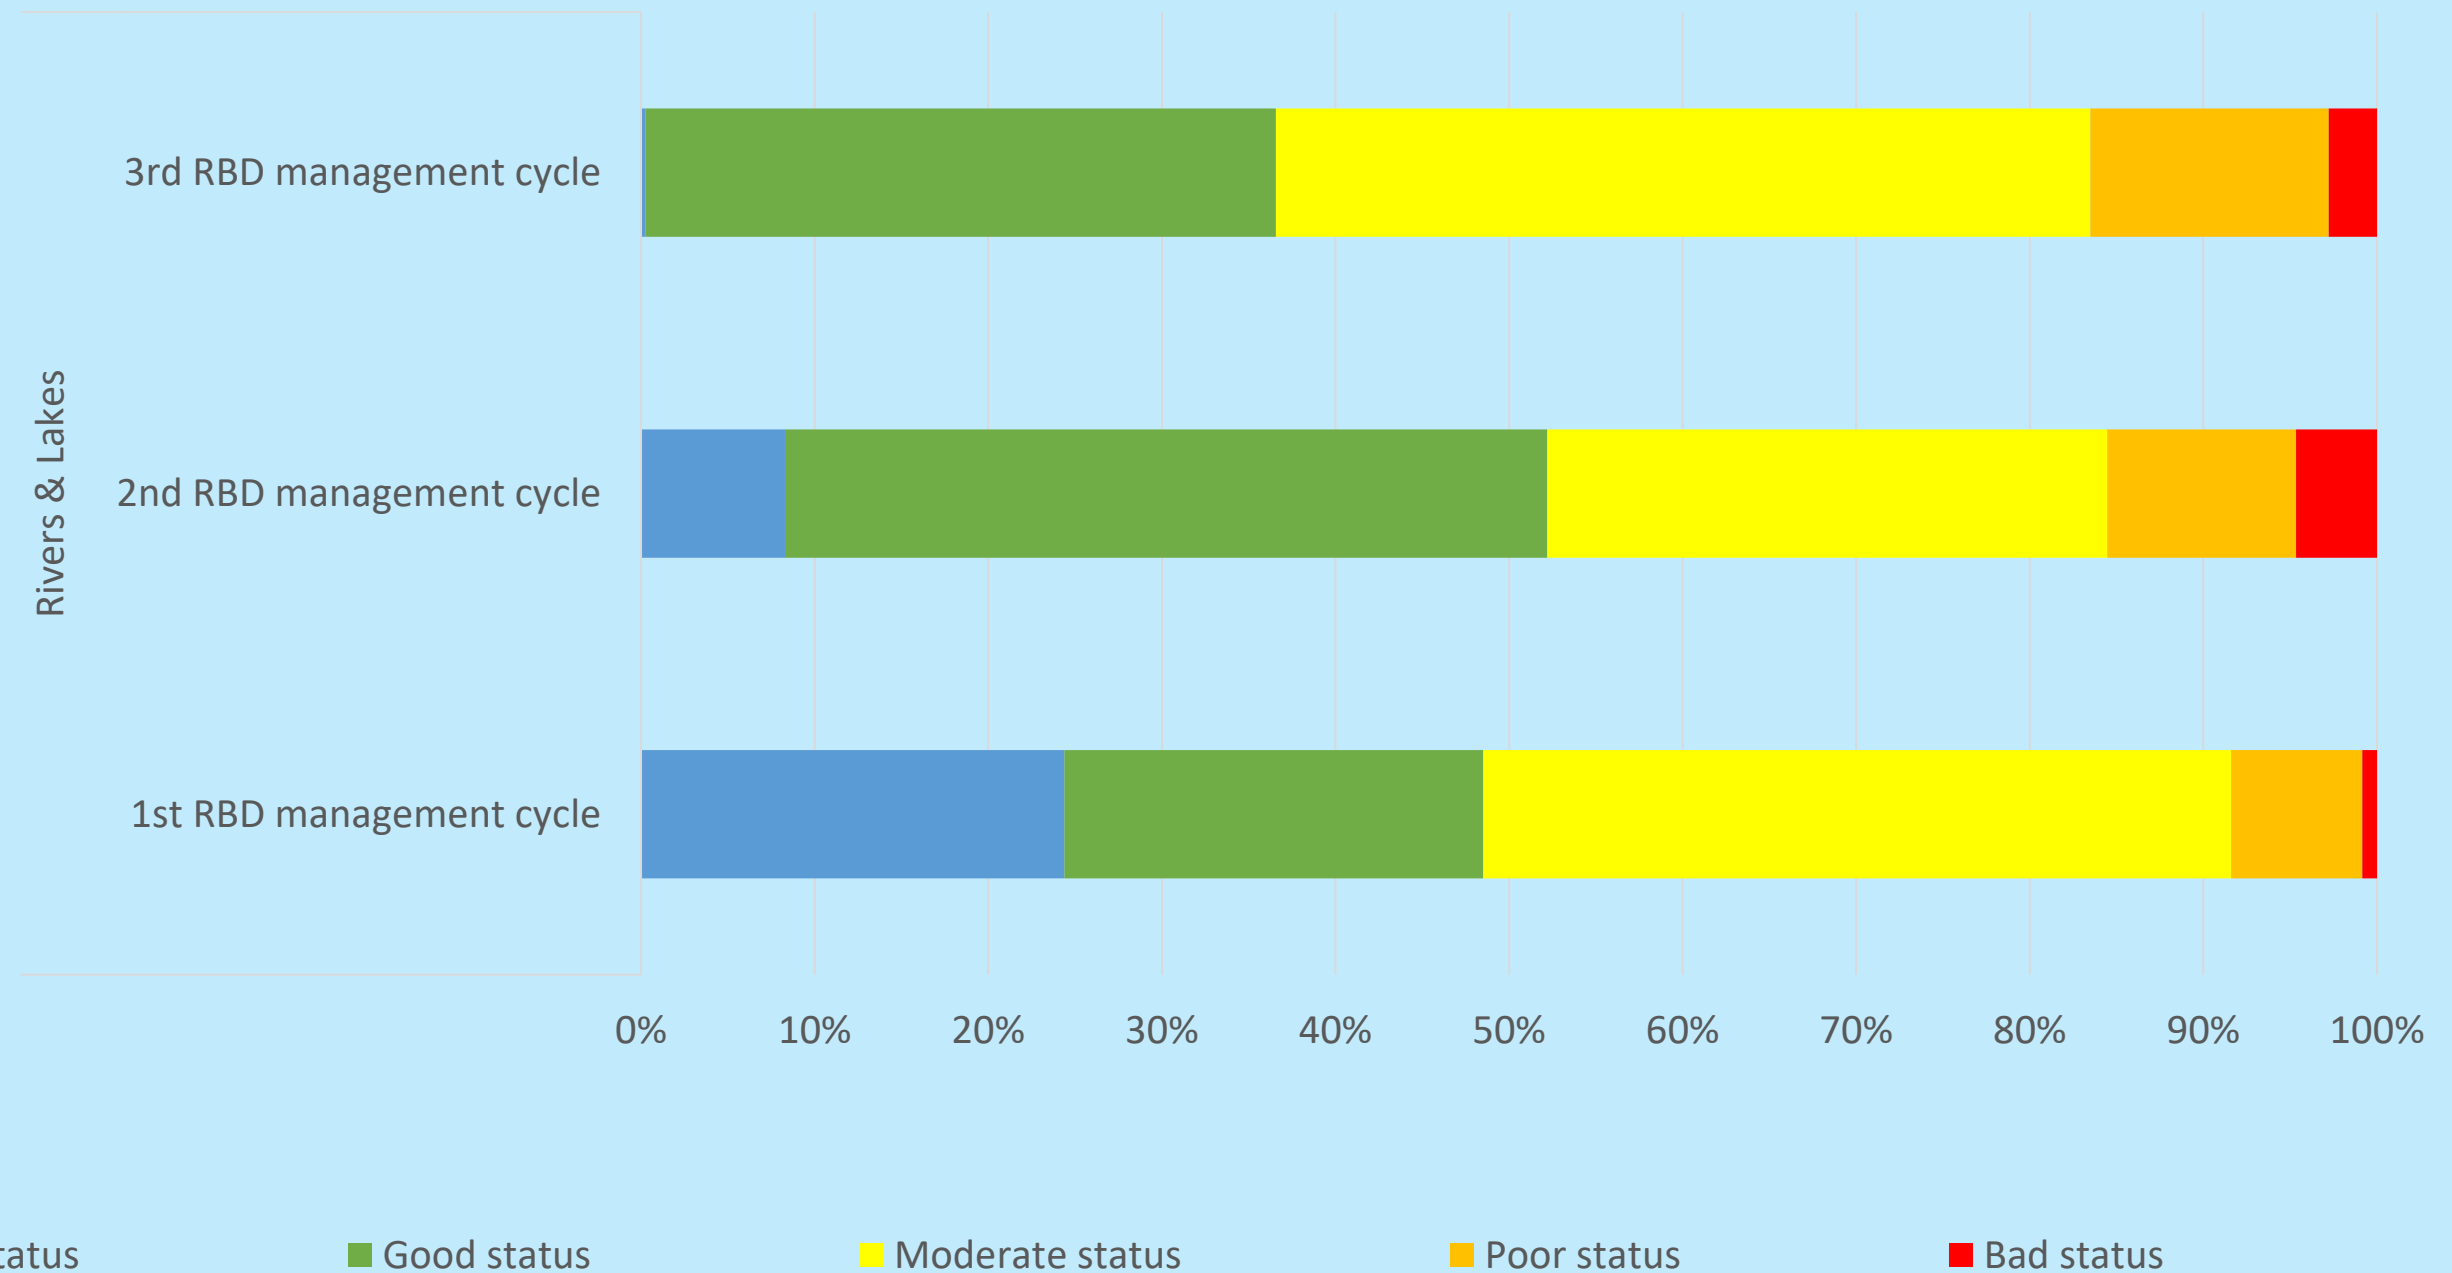

Almost half surface water bodies
have not reached good status

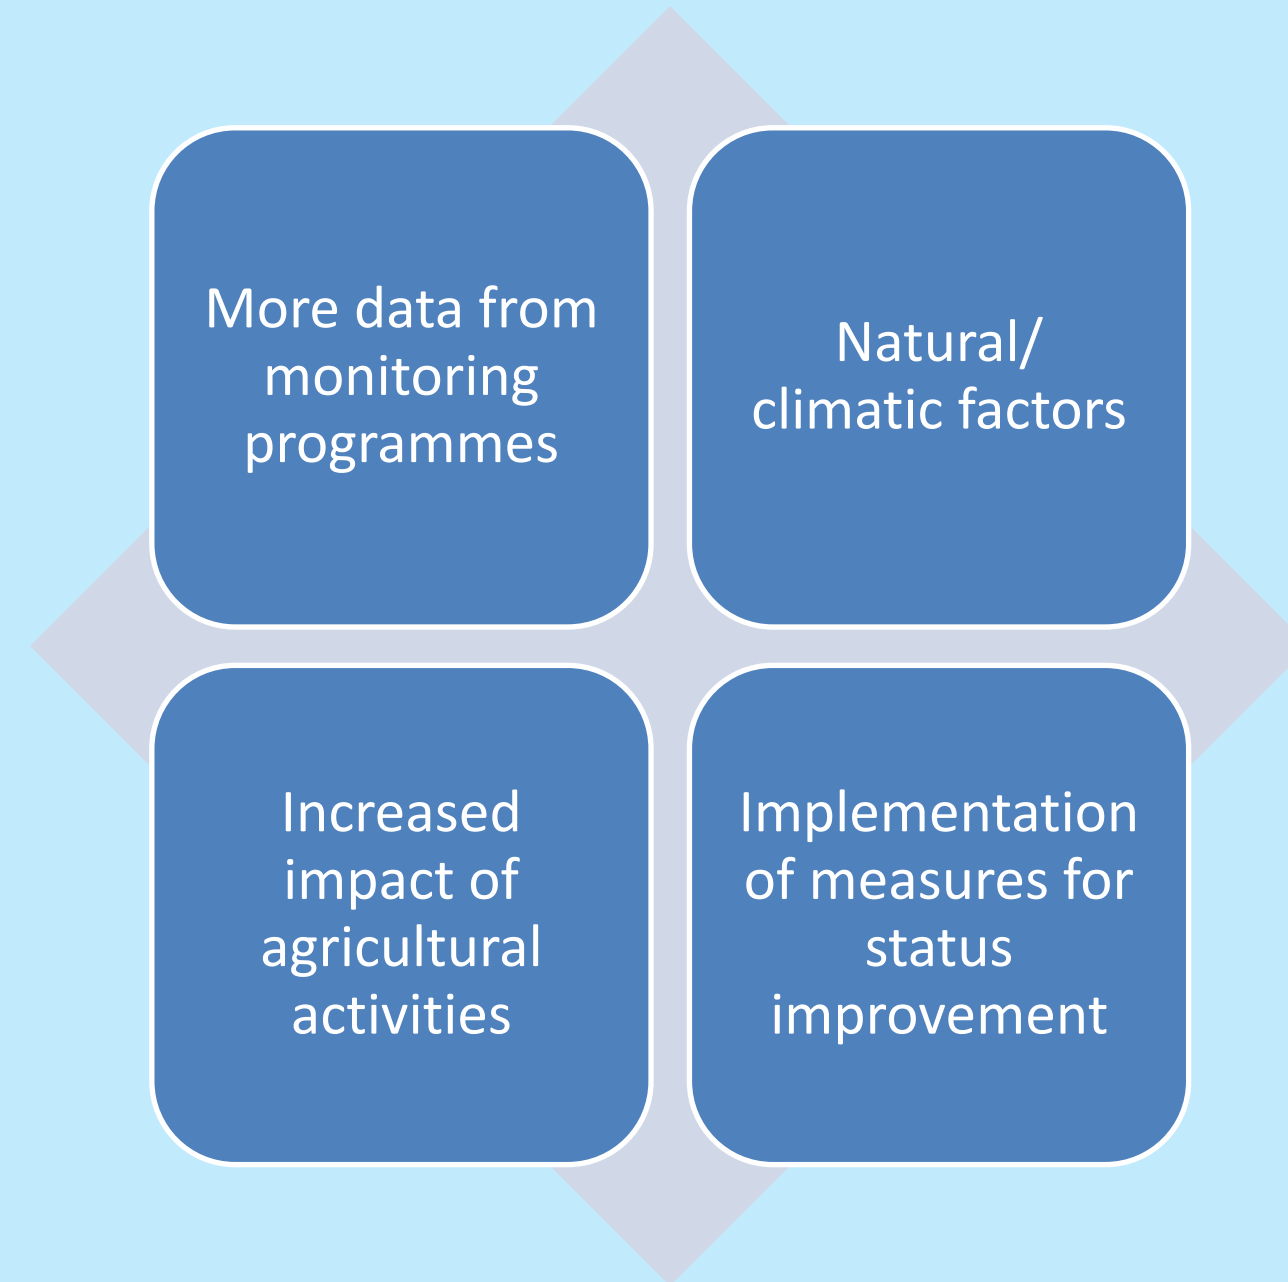

100% good status of groundwater

Changes in ecological status of surface water bodies

The main reasons for changes in ecological status of surface WBs

Monitoring of ecological status of surface water bodies

- During the 3rd RBD management cycle ecological status was monitored in

river water bodies

lake water bodies

**transitional and
coastal**

Management of chemical status

- Only 19 river water bodies (out of 826) and 1 lake water body (out of 361) where significant pollution is likely are monitored.
- Monitoring full list of priority and hazardous substances is extremely expensive.
- Chemical status is classified as unknown in unmonitored water bodies.

DEALING WITH DATA GAPS

- Grouping of water bodies for the purpose of ecological status assessment:
 - Representative monitoring sites are selected in water bodies of the same category, type, hydrological regime and anthropogenic impacts.
- Cooperation with neighbours (PL and LV) and data exchange (especially for assessment of chemical status).

DEALING WITH DATA GAPS (2)

- Mathematical modelling: SWAT model is set up by the EPA for the entire territory of Lithuania.
- Modelling problems:
 - difficult to capture phosphorus;
 - not good for lakes;
 - data on important inputs is missing or accuracy of data is insufficient;
 - data is needed for validation of modelling results.

Problems related to data scarcity

- The demand for measures can not be estimated (especially hydromorphological measures).
- Application of exemptions can not be properly justified. Lithuania does not apply Article 4(5), Article 4(6) and Article 4(7).

WHAT WE HAVE DONE?

Surface water pollution reduction from agriculture

The Code of Good Agricultural Practice updated in
2019

Methodology for fertilization plans and a database
for fertilizer declarations have been created in 2021

2023-2027 CAP Strategic plan was adopted

WHAT WE HAVE DONE? (2)

Hydromorphological alteration (I)

Funding mechanism created for municipalities to remove obsolete dams

Amendments in Water Law: requirements to remove obsolete dams and install fish passes on functional dams

Funding mechanism created for municipalities to remove obsolete dams

WHAT WE HAVE DONE? (3)

Hydromorphological alteration (II)

Ecological and socio-economical assessment of dams carried out

Dam and remains of dams removed in 3 rivers

Fish passes installed on 6 dams

River restoration projects carried out in 52 of rivers

FUTURE STEPS

LIFE SIP project will be signed this year

Connections in agglomerations – 63 agglomerations in total; 33 achieved 98% connection, 30 in progress

Wastewater Management Information System (register)
